

Did you know that you can easily make your own xylophone? The xylophone is a musical instrument that belongs to the percussion family. That means that it is played by hitting or striking. The xylophone sometimes looks similar to a piano and can be made out of many different materials. Let's try to make our own using glass bottles or other containers and water.

Activity Instructions: Find some containers made of glass. With a pencil or a small metal object, gently tap the glass. Does it make a sound? Now add some water to the container and tap it again. *Is the sound different or the same?*

Can you believe THIS is math?
